RAILWAY STATION Astana

In 1990, near the old station housing Astana was built new nine passenger terminal complex. Rapid population growth and capital due to the increased load on it became the main passenger terminal leitmotif started in summer 2003 Reconstruction station. Daily Home transport gate Republic sent about 4500 passengers.

Task

During the reconstruction of the building arose the need to equip it with the latest systems and voice messaging systems CCTV, both within the building and on the tracks included in the complex. As the task was set to establish ergonomic turnstiles.

Decision

To equip this object has been selected equipment warning system on Bosch based Plena. The building and grounds were Station divided into zones. To alert street zone were used spotlights and sound horns. CCTV cameras have been chosen Dinion, FlexiDome, AutoDome. One features of this project was the complexity Install two cameras system AutoDome, on a roof of the central nine-floor building of the station. All information coming from the cameras with fixed DVRs using Divar. In the halls of the station were installed turnstiles Gunnebo.

Result

Station officials say convenience Operating voice alarm system, especially the possibility of division into their listening area. CCTV system allows the service protection in order to preserve the special places crowds.
